

## DISPLAY METHOD AND APPARATUS FOR NAVIGATION SYSTEM

### Abstract of the Disclosure

5 A display method and apparatus for a navigation system  
which is capable of preventing blank scroll of a display  
screen when there is no visible objects within a display  
range when the screen is scrolled and immediately jumping to  
the screen where a visible object exists. When a display  
screen is scrolled, if there is no visible object within a  
10 display range of the scroll for a relatively long period of  
time, the display screen just shows a blank screen, which may  
confuse the user or make the user feel uneasy. The display  
method and apparatus avoids the blank scrolling by  
automatically scrolling to a screen where a visible object  
15 is shown.
